adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand coNA contains a library tag sequence that is located between the Not I site and the (AT)18 tail. The sequence tag for this library is CGCGTATACC. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI).

An isolated nucleic acid molecule for the treatment of angiogenesis-related disorder, such as cancers or diabetic retinopathy, encodes a endostatin protein. N-PSDB; AAL46063.

Claim 14; Fig 5; 56pp; English.

The present invention provides the protein and coding sequences of canine pro-endostatin and endostatin. The sequences can be used in the treatment and diagnosis of angiogenesis related disorders, including cancer, rheumatoid arthritis, psoriasis, retinopathy, macular degeneration,

corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, coronary collaterals, cerebral collaterals, arteriovenous malformations, ischaemic limb angiogenesis, diabetic neovascularisation, and fractures. The present sequence is the canine pro-endostatin protein sequence 8888888888888

N-PSDB; AAL46062

An isolated nucleic acid molecule for the treatment of angiogenesis-related disorder, such as cancers or diabetic retinopathy, encodes an endostatin protein.

Claim 14; Fig 3; 56pp; English.

The present invention provides the protein and coding sequences of canine pro-endostatin and endostatin. The sequences can be used in the treatment and diagnosis of angiogenesis related disorders, including cancer, rheumatoid arthritis, psoriais, retinopathy, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, obler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, coronary collaterals, cerebral collaterals, artificonenus malformations, ischaemic limb angiogenesis, diabetic neovascularisation, and fractures. The present sequence is the canine pro-endostatin protein sequence

```
The patent discloses a DNA molecule encoding a fusion protein comprising a signal sequence, an immunoglobulin Fc region, and an angiogenesis can signal sequence, an immunoglobulin Fc region, and an angiogenesis compared from angiostatin, endostatin, a plasminogen fragment having angiostatin activity, a collagen XVIII fragment having endostatin activity, or combinations of them. The fusion protein (immunofusin) is used to inhibit angiogenesis and to treated include solid tumours, blood born tumours, tumour metaetasis, benign tumours including heamangionas, acoustic neuromas, neurofibromas, trachomas and pyrogenic granulomas, rheumatoid arthritis, psoriasis, ocular angiogenic diseases of adabetic retinopathy, retinopathy of prematurity, macular glaucoma, retrolental fibroplasia, rubeosis and Osler-Webber syndrome; myocardial angiogenesis, planguettesia, hemophiliac joints, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis and Osler-Webber syndrome; myocardial angiogenesis, planguettesia, hemophiliac joints, angiofibroma, wound gramulation, and excessive or abnormal atimulation of endothelial cells, incestinal cells, atherosclerosis, sclerodermal and hypertrophic scarse, i.e. Rebloid scars: The DNA constructus may be used in the gene therapy. The present sequence is a canine endostatin used in the construction of immunofusin containing canine immunoglobulin Fc fragment
Novel fusion protein of angiostatin or endostatin and an immunoglobulin FC region, useful for treating conditions mediated by angiogenesis, such as rheumatoid arthritis, tumors and macular degeneration.
                                                                                                                              Example 8; Page 59-60; 68pp; English

New peptide useful for the preparation of medicaments with antiangiogenic activity that may be used in treating tumors or metastases, comprises a sequence corresponding to fragments of human endostatin.
                                                                                                                                                                                                       The invention relates to peptide comprising 20-50 amino acids with sequences corresponding to the human endostatin polypeptide sequence, its salt or non-toxic derivative. The peptides are useful in the preparation of medicaments with antiangiogenic activity which may be useful in treating tumours or metastases. This sequence represents a murine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 VRRADRAAVPIVVNLKDELLFFSWEALFSGSEGPLKFGARIFSFDGKDVLRHPTWFQKSVW 120

The sequence represents Human Endostatin(TM) C-terminus minus 2 protein, a natural variant lacking the C-terminal 2 amino acids of Endostatin(TM) crecovered from fermentations of Pichia patorists cultures harbouring a expression plasmid containing the Endostatin(TM) DNA sequence given in AAS00867. The new method of the invention is useful for producing, recovering and purifying Endostatin (TM) from biological sources, such as biological fluids, tissues, cells, culture media, and fermentation media. Endostatin(TM) is useful for treating angiogenesis mediated diseases, benign tumours, lood borner tumours, leukaemias, tumour metastases, benign tumours, e.g. haemangioma, rheumatoid arthritis, psoriasis, contain angiogene granulomas, rheumatoid arthritis, psoriasis, contain angiogene granulomas, rheumatoid arthritis, psoriasis, contain angiogenesis, platone neovascularisation, neovascular glaucoma, colon cancer, retrolental fibroplasia, rubecais, Osler-Webber Syndrome, myocardial angiogenesis, platone neovascularisation, neovascularisation, telangisectasia, haemophiliac joints, angiofibroma, and wound granulation. Endostatin(TM) is also useful for treating disease of excessive or abnormal stimulation of endochelial cells such as intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. Higher yields of more purified, and biologically active Endostatin(TM) are obtained by the crew purified, and also subjected to lyophilisation, while preserving to production is avoided, preventing unwanted potential cellular lysis and contamination with additional proteins, pigments, enzymes and other centumination with additional proteins, pigments, enzymes and other Producing Endostatin protein for treating angiogenesis mediated diseases such as solid tumors, comprises recombinantly producing the protein using an expression system, and recovering and purifying the protein. New endostatin oligomers, used for treating e.g. tumors

WPI; 2000-072833/06.

Disclosure; Page 6; 44pp; English.

This sequence is a fragment of the human endostatin protein. Endostatin is an approximately 20kD C-terminal globular domain of the collagen-like protein collagen XVIII. Protein oligomers consisting of more than one edostatin monomer have anti-tubulogenic effects and induce constant and induce recorganization of the actin cytoskeleton. The oligomer has scatter factor crivity. The oligomers induce the destruction of tubular lumens and colligomers and also be used to treat metastatic cancers, tumours, colligomers can also be used to treat metastatic cancers, tumours, construction, plaque neovascularisation, telangiectasia, haemophiliac joints, syndrome, plaque neovascularisation, telangiectasia, haemophiliac joints, colligomers expectation and wound granulation. The oligomers can also be used to treat diseases that have anglogenesis as a patchological consequence e.g. ulcers. The endostatin oligomers can also be used to develop affinity collumns for isolating antibodies or receptors. Passive antibody therapy columns for isolating onligomers can also be used to develop affinity with antibodies that specifically bind endostatin oligomers can be used to the morphogenic processes such as metastatic cancer as well as a natisera directed to the Pab regions of endostatin oligomer antibodies can be administered to block the ability of endogenous endostatin colligomer antibodies can be administered to block the ability of endogenous endostatin colligomers.

The present invention relates to anti-Vascular Endothelial Growth Factor (VEGF) antibodies that bind to the same epitope as the monoclonal antibody ATCC PTA 1595 and which significantly inhibit VEGF binding to the VEGF receptor VEGFR2, without inhibiting VEGF binding to the VEGF receptor VEGFR1. The present sequence is human endostatin. Endostatin may be conjugated onto the anti-VEGF antibodies of the present invention. The anti-VEGF antibodies of the present invention. The treatment and diagnosis of cancer, especially vascularised solid tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        121 HGSDPSGRRLTDSYCETWRTEAPAATGQASSLLAGRLLEQEAASCRHAFVVLCIENSVMT 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is an endostatin protein which is the carboxy terminal protein of human collagen XVIII. Recombinant mouse endostatin (20 mag/Kg) was administered subcutaneously to mice implanted with Lewis lung carcinomas. There was tumour mass regression non-detectable levels after 12 days of therapy due to the angiogenesis inhibitory activity of endostatin. Thus the protein is useful for treatment of angiogenesis. Comparation are useful for treatment of angiogenesis. Comparation are useful for treating and diagnosis of tumours, ocular cangenes diseases. Osler-Webber syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma and wound granulation of endothelial cells e.g. intestinal achesions, atherosclerosis, scleroderma. The protein may also be useful as birth control agent by reducing or preventing uterine as a birth control agent by reducing or preventing uterine calls or tissue that express high levels of endostatin may be isolated from cells or the protein may also be useful the control agent by reducing or preventing uterine calls or tissue that express high levels of endostatin, eg. tumour cells or the protein may also be useful the control as a birth control agent by reducing or preventing uterine calls or the control as a birth control agent by reducing or preventing uterine calls or the control as a birth control agent by reducing are preventing uterine calls or the control as a co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel endostatin capable of inhibiting endothelial cell proliferation and angiogenesis, useful for treating angiogenesis-dependent cancers and as birth control agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 VRRADRAAVPIVNLKDELLFPSWEALFSGSEGPLKPGARIFSFDGKDVLRHPTWPQKSVW 120

WPI; 2001-244802/25. N-PSDB, AASO0897 Producing Endostatin protein for treating angiogenesis mediated diseases such as solid tumors, comprises recombinantly producing the protein using an expression system, and recovering and purifying the protein.

Claim 5; Page 30; 67pp; English.

The sequence represents Human Endostatin(TM) C-terminus minus 1 protein,
a natural variant lacking the C-terminal amino acid of Endostatin(TM)
c recovered from fermentations of Pichia pastoris cultures harbouring a
expression plasmid containing the Endostatin(TM) DNA sequence given in
AASO0867. The new method of the invention is useful for producing,
c recovering and purifying Endostatin (TM) from biological sources, such as
biological fluids, tissues, cells, culture media, and fermentation media.
Endostatin(TM) is useful for treating angiogenesis mediated diseases such
as solid tumours, blood borne tumours, leukaemias, tumour mediated
c solid tumours, e.g. haemangioms, rheumatoid arthritis, psoriasis,
c benign tumours, e.g. haemangioms, rheumatoid arthritis, psoriasis,
c benign tumours, e.g., pastulomas, rheumatoid arthritis, psoriasis,
c prematurity, macular degeneration, corneal graft rejection, neovascular
c plantome, myocardial angiogenesis, plaque neovascularisation,
c syndrome, myocardial angiogenesis, plaque neovascularisation,
c clangiccrasis, heemophiliac joints, angiofibroma, and wound granulation.
c clangiccrasis, solerodermes and hypertrophic scars. Higher yields of
atherosclerosis, scleroderme and hypertrophic scars. Higher yields of
more purified, and biologically active Endostatin(TM) are obtained by the
method. Endostatin(TM) can be stored in buffers for extended periods
of time, and also subjected to lyophilisation, while preserving
blological activity. Centrifugation of broth from fermentation steps in
c production is avoided, preventing unwanted potential cellular lysis and

The present invention relates to antibody-based compositions comprising an immunoconjugate such as anti-vascular endothelial growth factor (WBGF) antibody (Ab) (or its antigen-binding fragment), attached to a biological agent, where the Ab binds to the same epitope as the monoclonal antibody (MAD) 2C3 ATCC PTA 1595, and significantly inhibits VEGF binding to the

UEGF receptor VEGFR2 (KDR/FIk-1) without inhibiting VEGF binding to the USGF receptor VEGFR2 (FIL-1). The compositions of the invention are useful in therapy, and diagnosis, for inhibiting angiogenesis in an an animal having ocular neovascular disease or macular degeneration, and for delivering a biological agent to a vascularised tumour. The compositions or avacularised solid tumour, a metastatic tumour or metastases from a primary tumour. The composition is useful for specifically inhibiting VEGF-induced andorbelial cell proliferation, without significantly inhibiting vEGF-induced anarophage, osteoclast or chondroclast function. The compositions can be used for treating various diseases such as inflammatory disorders, atherosclerosis, diseases such as restenosis, acquired immune deficiency syndrome (AIDS), blood borne tumours, corneal graft rejection, Crohn's disease, fungal ulcers, infections human endostatin. Endostering may be attached or functionally associated with anti-VEGF antibodies

                                                                                                       The specification describes multifunctional proteins which comprise combinations of angiostarin, endostatin, interferon, thrombospondin, interferon-inducible protein and platelet factor 4, and have anti-angiogenic and/or anti-tumor activity. The multifunctional protein may exhibit useful properties such as having similar or greater biological activity when compared to a single factor or by having improved half-life or decreased adverse side effects, or a combination of these properties. The proteins can be used for treating an angiogenic-mediated disease, e.g. cancer, diabetic retinopathy, macular degeneration, or arthritis. They can also be used for inhibiting the production of tumor cells (characteristic of lung, breast, ovarian, prostate, pancreatic, gastric, colon, renal, bladder cancers, melanoma, hepatoma, sarcoma and lymphoma) in a patient and for inhibiting tumor growth. The present sequence is used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             121 HGSDPSGRRLTDSYCETWRTEAPAATGQASSLLAGRLLEQEAASCRHAFVVLCIENSVMT 180

Disclosure; Page 74-75; 83pp; English. Anti-angiogenic gene therapy vectors. WPI; 1999-357696/30, N-PSDB; AAX77719. REALEX SECOND CONTROL 
This invention describes a novel viral gene therapy vector comprising a nucleic acid molecule encoding an anti-angiogenic polypeptide chosen from human or murine angiogentin, human or murine endostatin and angiogenesis-inhibiting fusions and fragments, where the viral vector is sufficiently attenuated for use in human gene therapy. The products of the invention have anti-angiogenic, cytostatic, anti-diabetic and ophthalmological activity. The vector is used in gene therapy for inhibiting tumour growth in humans harbouring a solid tumour. The vector expresses an anti-angiogenic polypeptide. An additional use comprises treatment of diabetic retinograthy, where the anti-angiogenic polypeptide inhibits angiogenesis in the vicinity of the retina. The vector is administered to cells exvivo and then administered to the patient

WPI; 2000-237616/20. N-PSDB; AAZ51291 Novel fusion protein of angiostatin or endostatin and an immunoglobulin FC region, useful for treating conditions mediated by angiogenesis, such as rheumatoid arthritis, tumors and macular degeneration.

Example 1, Page 41-42; 68pp; English.

a signal sequence, an immunoglobulu For region, and an anglogenesis inhibitor selected from angiostatin, endostatin, a plasminogen fragment having angiostatin activity, a collagen XVIII fragment having endostatin activity, or combinations of them. The fusion protein (ammunofusin) is used to inhibit angiogenesis and to treat diseases or conditions mediated by angiogenesis. Conditions that may be treated include solid tumours, blood born tumours, tumour metastasis, benign tumours including has acoustic neuromas, neurofibromas, trachomas and pyrogenic granulomas, rheumatoria arthritis, psoriasis, ocular angiogenic diseases e.g. diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental clish intestinal cells, and excessive or abnormal stimulation of endothelial cells, intestinal cells, atherosclerosis, selectedermal and hypertrophic scars, i.e. keloid scars. The DNA constructs may be used in gene therapy. The present sequence is a human endosteatin used in the construction of immunofusin containing human immunoglobulin gamma (19G) The patent discloses a DNA molecule encoding a fusion protein comprising

```
This invention relates to angiogenesis-inhibiting protein receptors, and the DNA sequences encoding them. Angiogenesis is the generation of new blood vessels into a tissue, and normally occurs in wound healing, foetal and embryonal development and the formation of the corpus luteum, condemetrium and placenta. Angiostatin is a protein (see AAB16450 and AAA88202) involved in angiogenesis, and has an amino acid sequence similar to that of a plasminogen fragment (see murine plasminogen con AAA88203). Angiostatin has the ability to inhibit angiogenesis.

CAAA88203). Angiostatin has the ability to inhibit angiogenesis.

CAAA88203). Sequences AAA88242 and AAB16522 represent coding and protein sequences of human laminin. Laminin is an angiostatin binding protein.

Cand some of the peptides of the invention share homology with regions of and some of the peptides of the invention share homology with regions of cand some of the invention conducted the invention. The peptides bind either anglostatin or endostatin and can be used in methods of the tracting diseases and processes that are mediated by angiogenesis, crohn's diseases and processes that are mediated by angiogenesis, crohn's diseases and processes that are mediated by angiogenesis, crohn's disease, cerebral collaterals, arteriovenous malformations, the leavent related diseases, fractures, placentation and cat scratch fever. They are useful for the detection and prognosis of cancer. DNA sequences A628204-A628241 encode the peptides of the invention
                                                                                                                                                                                                                                                            New angiogenesis-inhibiting protein receptors, useful in methods for treating diseases and processes that are mediated by angiogenesis, sa solid tumors, psoriasis, scleroderma and myocardial angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                                Disclosure, Fig 3; 100pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HGSDPSGRRLTDSYCETWRTEAPAATGQASSLLAGRLLEQEAASCRHAFVVLCIENSVMT 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents an angiogenesis inhibiting factor (1), designated IAF-1. The present invention also describes: (1) preparation of (1) and its derivative; (2) an IAF binding acceptor and its preparation; and (3) an IAF antibody. (1) is useful for preparing new biological preparations for effectively treating various tumours and abnormal-vessel diseases. The IAF antibody is preferably a polyclonal antibody, mosaic antibody, single stranded antibody and human originated
                                                                                                                                                                                                                                                                                                                                                         Anglogenesis inhibiting factor 1 and its derivative useful for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    US-09-561-499-13

Sequence 13, Application US/09561499

Sequence 13, Application US/09561499

Patent No. 6524683

GENERAL INFORMATION:

APPLICANT: Philip 2. Thorpe

APPLICANT: Rolf A. Brekken

TITLE OF INVENTION:

ANTHEODY METHODS FOR SELECTIVELY INHIBITING VEGF

TITLE OF INVENTION:

CURRENT FILING DATE: 4001-005882

CURRENT FILING DATE: 2000-04-28

FRIOR PPLICATION NUMBER: 60/131,432

PRIOR FILING DATE: 1999-04-28

NUMBER OF SEQ ID NOS: 44

SOFTWARE PATENTION FOR SEQ ID NOS: 44

SOFTWARE PATENTION FOR SEQ ID NOS: 44

Patent No. 6346510

GENERAL INFORMATION:
APPLICANT: Folkman, Judah
APPLICANT: O'Reilly, Michael
TITLE OF INVENTION: Flexapeutic Antiangiogenic Endostatin Compositions
FILE REFERENCE: 05213-0229
CURRENT APPLICATION NUMBER: US/09/315,689
CURRENT FILING DATE: 1999-05-20
NUMBER OF SEQ ID NOS: 6
SOFTWARE: Patentin Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0; Gaps

A51019

Collagen alpha 1(XVIII) chain - human (fragment)

N;Contains: endostatin

N;Contains: endostatin

N;Contains: endostatin

C;Species: Homo aspiens (man)

C;Species: Homo aspiens (man)

C;Accession: A53019

C;Accession: A530

A; Accession: A53019; Moldistrated A; Accession: A53019
A; Molecule type: mRNA
A; Residues: 1-684 < CMAA
A; Residues: 1-684 < CMAA
A; Residues: 1-684 < CMAA
A; Coss. references: GB:L22548; NID:G348908; FIDN:AAA51864.1; FID:G562794
A; Note: the cited accession number, L25548; is not in Genbank release 103
A; Note: in the authors' translation, 482-G1y is not shown, residues 483-490 are shifted C; Comment: Prolines and lysines at the third position of the tripeptide repeating unit lated and subsequently O-glycosylated.
C; Comment: Different splice forms of collagen alpha 1 (XVIII) may be involved in perivasi C; Comment: Endostatin is released from collagen alpha 1 (XVIII) chain by the action of will be useful in treating solid tumors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DOMAIN
```

```
Proc. Natl. Acad. Sci. U.S.A. 89:10144-10148 (1992).

1- TISSUE SPECIFICITY: Expressed predominantly in internal organs such as adrenal gland, pancreas and kidney.

1- PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.

1- SIMILARITY: BELICES (FACIT) FARIL-ASSOCIATED COLLAGENS WITH INTERRUPTED HELICES (FACIT) FAMILY.

1- SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.

Dev. Biol. 180:273-283(1996).

-!- PUNCTION: MAY REGULATE THE TRANSCRIPTION OF SPECIFIC GENES DURING NORMAL DEVELOPMENT. MAY PLAY A ROLE IN CRANIOFACITAL DEVELOPMENT AND DIGITAL DEVELOPMENT, AS WELL AS DEVELOPMENT OF THE CENTRAL NERVOUS SYSTEM AND GASTROINTESTINAL TRACT. IMPLICATED IN THE TRANSDUCTION OF SH4 SIGNAL (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: Nuclear:
-!- SIMILARITY: BELONGS TO THE GLI FAMILY OF C2H2-TYPE ZINC-FINGER
                                                                                                                                                                                                                                                                                                                                                                                                                            01-NOV-1997 (Rel. 35, Created)

T "Cloning of the CDNA for the human NUMA receptor NNEAC subunit and its

T expression in the central nervous system and periphery.";

Brain Res. Mol. Brain Res. 43:57-64(1996).

LI FUNCTION: NUMBA receptor subtype of glutemate-gated ion channels

Witch high calcium permeability and voltage-dependent sensitivity

LO magnesium. Mediated by glycine.

LI SUBDELLULAR LOCATION: Integral membrane protein.

LISSUE SPECIFICITY: Mainly in brain with predominant expression is

In the cereballum, also present in the hippocompus, amygdala,

Candate mucleus, corpus callosum, subchalamic nuclei and thalamus.

Detected in the heart, skeletal muscle and pancreas.

LISSUELLARITY: Belongs to the ligand-gated ionic channel family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright.
